

# One-dimensional Conservation Law Solver

Computing Burgers solution using a DG-FEM routine with Polynomial truncation for the nonlinear terms.

for solving the following problem:

$$u_t + f(u)_x = s(u)$$

where  $f(u)$  and  $S(u)$  can be For linear advection eq.:  $f(u) = a*u$  and  $s(u) =$  any function of  $u$  For non-linear advection:  $f(u) = u^2/2$  and  $s(u) =$  any function of  $u$

Function residual will be defined as:

$$Residue(u) = -f(u)_x + s(u)$$

Based on ideas of the following papers:

1. TVB Runge-Kutta Local Projection Discontinuous Galerkin Finite Element Method for conservation laws II: General Framework. (1989)
2. Runge-Kutta Discontinuous Galerkin Method Using WENO Limiters. (2005)

w_output = 0;                 % Write output: {1} YES please!, {2} NO

```

## Define Grid Cell's (Global) nodes

Building nodes for cells/elements:

```

x_left = 0; x_right = 1; dx = (x_right-x_left)/nx;
x_nodes = x_left : dx : x_right; % cells nodes

```

## flux function

```

switch equation
case{1} % Scalar advection Eq. flux:
    F = @(w) a * w;
    % and derivate of the flux function
    dF = @(w) a*ones(size(w));
case{2} % Inviscid Burgers Eq. flux:
    F = @(w) w.^2/2;
    % and derivate of the flux function
    dF = @(w) w;
end

```

## Source term function

```

switch include_s
case{0} % no source term
    S = @(w) zeros(size(w));
case{1} % with source term
    % example source term
    S = @(w) w.^2;
end

```

## SETUP

1. Build Cells/Elements (Local) inner points (quadrature points).
2. Build

Weighting values for our local. 3. Build Vandermonde Matrix for our local quadrature points.

```
